Outline

- 1 Introduction
- 2 Learn the basics
- 3 Make your own Resume!

- LaTeX (pronounced “Lay-TECK”) is a document preparation system built by Leslie Lamport, as a set of macros built off of “TeX”, a less user friendly version developed by Donald Knuth in 1978(!)
- Compare and contrast my (poorly formatted) **physics ia** written in Word to my better formatted **physics lab report** in LaTeX
- Most STEM resumes are made with some variant of **RenderCV**, so you may want to make yours look like that.

Get started!

- 1 If you haven't, make a free overleaf account [here](#)
- 2 You can either use the provided tex doc or copy paste [this](#) document.
- 3 You (probably) won't actually "publish" a template, but if you want your own template to make notes, you can have it like [my sociology notes template](#) and continuously make copies. Even though sociology isn't "STEM", you can still make really good looking [notes](#)

Bibliographies

- 1 Bibliographies are a bit harder to show, you can use **Bibtex**
- 2 For example, you can look at our **civ design report**.

"Animation" example

- Hello

"Animation" example

- Hello
- Hello again

"Animation" example

- Hello
- Hello again
- This is getting a bit awkward . . .

- Go to [RenderCV](#) and try playing around with it!
- Manasva Katyal's [resume](#)
- [click here](#)

Conclusion

- Questions?
